TGS 821 - Special Sensor for Hydrogen Gas

Features:

* High sensitivity and selectivity to hydrogen gas
* Good repeatability in measurement and excellent stability
* Uses simple electrical circuit
* Ceramic base resistant to severe environment

Applications:

* Hydrogen gas detection for:
  - transformer maintenance
  - batteries
  - steel industry usage
  - etc.

The sensing element of Figaro gas sensors is a tin dioxide (SnO₂) semiconductor which has low conductivity in clean air. In the presence of a detectable gas, the sensor’s conductivity increases depending on the gas concentration in the air. A simple electrical circuit can convert the change in conductivity to an output signal which corresponds to the gas concentration.

The TGS 821 has high sensitivity and selectivity to hydrogen gas. The sensor can detect concentrations as low as 50ppm, making it ideal for a variety of industrial applications.

The figure below represents typical sensitivity characteristics, all data having been gathered at standard test conditions (see reverse side of this sheet). The Y-axis is indicated as sensor resistance ratio (Rs/R₀) which is defined as follows:

\[ Rs = \text{Sensor resistance of displayed gases at various concentrations} \]
\[ R₀ = \text{Sensor resistance at 100ppm of hydrogen} \]

The figure below represents typical temperature and humidity dependency characteristics. Again, the Y-axis is indicated as sensor resistance ratio (Rs/R₀), defined as follows:

\[ Rs = \text{Sensor resistance at 100ppm of hydrogen at various temperatures/humidities} \]
\[ R₀ = \text{Sensor resistance at 100ppm of hydrogen at 20°C and 65% R.H.} \]

IMPORTANT NOTE: OPERATING CONDITIONS IN WHICH FIGARO SENSORS ARE USED WILL VARY WITH EACH CUSTOMER’S SPECIFIC APPLICATIONS. FIGARO STRONGLY RECOMMENDS CONSULTING OUR TECHNICAL STAFF BEFORE DEPLOYING FIGARO SENSORS IN YOUR APPLICATION AND, IN PARTICULAR, WHEN CUSTOMER’S TARGET GASES ARE NOT LISTED HEREIN. FIGARO CANNOT ASSUME ANY RESPONSIBILITY FOR ANY USE OF ITS SENSORS IN A PRODUCT OR APPLICATION FOR WHICH SENSOR HAS NOT BEEN SPECIFICALLY TESTED BY FIGARO.
Structure and Dimensions:

Pin Connection and Basic Measuring Circuit:
The numbers shown around the sensor symbol in the circuit diagram at the right correspond with the pin numbers shown in the sensor’s structure drawing above.

When the sensor is connected as shown in the basic circuit, output across the Load Resistor (VRL) increases as the sensor’s resistance (Rs) decreases, depending on gas concentration.

Standard Test Conditions:

TGS 821 complies with the above electrical characteristics when the sensor is tested in standard conditions as specified below:

Test Gas Conditions: 20±2°C, 65±5%R.H.
Circuit Conditions: Vc = 10.0±0.1V (AC or DC), Vh = 5.0±0.05V (AC or DC), Rl = 4.0kΩ±1%
Preheating period before testing: More than 7 days

Sensor Resistance (Rs) is calculated by the following formula:

\[
Rs = \left( \frac{Vc}{VRL} - 1 \right) \times RL
\]

Power dissipation across sensor electrodes (Ps) is calculated by the following formula:

\[
Ps = \frac{Vc^2 \times Rs}{(Rs + RL)^2}
\]
